## Parlay i60 ISDN Access Multiplexer with Advanced Routing Features

- ◆ Cost efficient ISDN provisioning
- ◆ Unique routing and access applications
- ◆ Powerful platform for Carriers and System Integrators

*Parlay i60 ISDN Access Multiplexer – a small miracle in terms of possible applications*

The Parlay i60 provides cost efficient, highly flexible and very reliable voice / data access and network solutions. It is designed to fulfil almost any wish for voice and data multiplexing and routing and is a small miracle in terms of possible applications. The Parlay i60 splits ISDN PRI into a number of (fractional) PRI lines. It converts ISDN PRI / E1 into ISDN BRI interfaces in a very flexible manner. On top of this, it features sophisticated call routing and call detail record options.

Use of the Parlay i60 does not usually require any PBX modifications at customer premises. Call routing, line splitting etc. is handled by the i60.

Carriers operating large quantities of Parlay i60 units will benefit from extensive remote management options, based on the Partner Voxstream Router-Center system.

Partner Voxstream develops advanced fixed network telecom products which:

- help telecom carriers establishing and adding value to the local loop
- provide enterprises with cost optimising telecom solutions and improve customer service levels

Partner Voxstream customers benefit from:

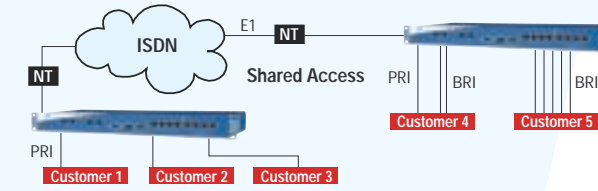

- Fast responding and reliable customer support including product training, hotline service and on-site service with short reaction time
- Superior product performance including time-saving installation and maintenance
- Short implementation time for customised product features
- Adaptation to country or vendor specific requirements

*With the Parlay i60 you can reduce costs and improve the service level*

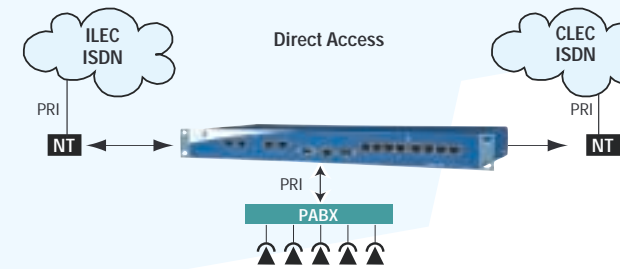

## Carrier Solutions

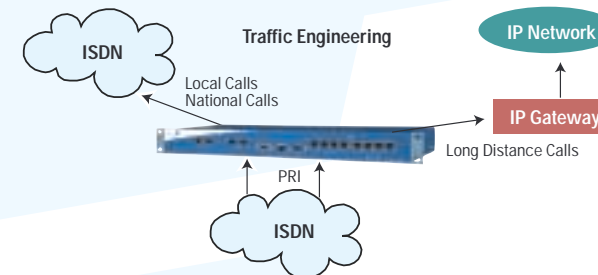

- ◆ **Shared Access**  
Cost reduction: Connection of 2 or 3 customers (PRI and BRI service) via a single E1 line

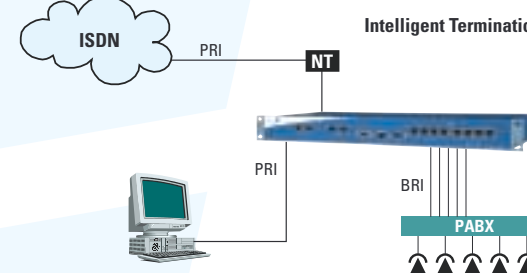

- ◆ **Direct Access**  
Cost reductions: Competitive carriers can provide a separate PRI line for outgoing calls without any expensive changes to the customer PBX

- ◆ **Traffic Engineering**  
Selective service offering: Routing of calls to different interfaces (services) depending on called number, calling number, type of service, time of day etc.

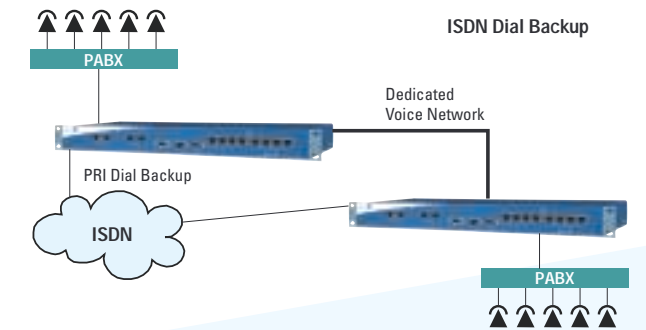

- ◆ **Intelligent Termination**  
Cost reductions: ISDN PRI and BRI interfaces supplied to the customer – via a single ISDN PRI line

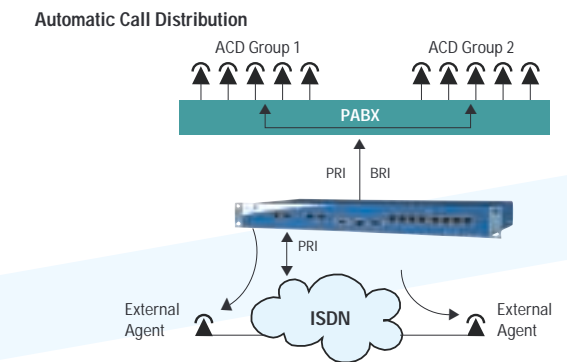

## System Integrator Solutions

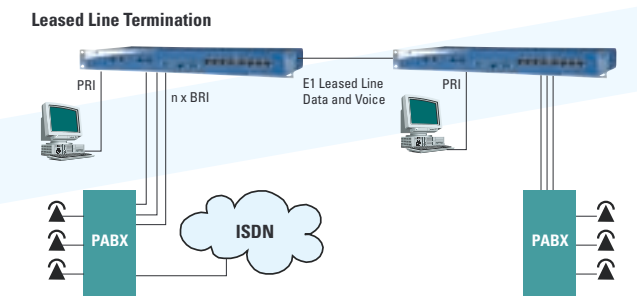

- ◆ **ISDN Dial Backup**  
Safety: Automatic and cost-efficient re-routing via the public network in case of disrupted corporate network lines

- ◆ **Automatic Call Distribution**  
Cost-efficient ACD: Distributes inbound calls to different ACD groups including external agents

- ◆ **Leased Line Termination**  
Cost reductions: Utilise the corporate network for both voice and data
